

Patent Analysis

Energy & Utilities

The client was a global energy and petrochemicals group utilizing innovative and advanced technologies to deliver sustainable growth. The client also functions in the field of fuel for marine applications for optimizing efficiency in marine equipment, increasing reliability and lowering costs across vessel operations.

Client Requirement

The client was interested in assessing specific fuel components (e.g. pyrolysis oil, biodiesel, methanol/DME, etc.) which have just penetrated the market or may be marketable in future for marine applications

The client also wanted information in areas such as potential availability of each fuel component, development status, benefits, potential challenges/issues related to fuel components

Netscribes' Solution

Netscribes addressed the client's requirement by tracking the published patents/applications, scientific articles, product of client's interest

Based on the analysis of the tracked information, Netscribes provided an executive summary and a detailed report on the technical areas of client interest

Data from different sources in the public domain including patents, published reports & articles, industry portals, academic papers, company websites, business magazines & publications, databases and press releases were collated by Netscribes

The report included highlights and insights on development status, recent projects, patent innovation trend, market potential, benefits, challenges, environmental rules and regulations for each of the specific fuel component for marine application
